

DevHack 7.0 - A CodeCraft Sprint

Hackathon Problem Statement

Theme: Improving Everyday Financial Experiences

Context and Motivation

Everyday financial interactions have become frequent, fast, and digital, but not necessarily easier or more intuitive. Individuals are expected to manage spending, payments, commitments, and financial decisions across multiple touchpoints, often with limited clarity or confidence. While access to financial tools has expanded, simplicity, trust, and meaningful guidance have not kept pace.

There is a growing need for systems that improve everyday financial experiences by aligning usability, intelligence, and security, without adding complexity or cognitive burden.

Problem Statement

Design and build a solution that improves everyday money-management experiences through **simple, secure, and smart** financial tools. Your solution should help users better understand their financial situation, reduce friction in daily transactions, and support informed decision-making.

Mandatory Dashboard

The solution must be centered around a primary dashboard that functions as the central hub for financial activities.

Suggested Directions

Teams are encouraged to implement multiple capabilities, combine them creatively, or propose an alternative approach that serves the same objective.

Core FinTech Capabilities

- Aggregate income and transactions
- Classify transactions into meaningful categories
- Visualise income versus expenditure
- Enable budget management that adapts to real-time income changes
- Forecast short-term cash flow or liquidity
- Provide signals such as overspending or anomalous behaviour
- Show the immediate financial impact of a transaction (before vs after)
- Detect suspicious or fraudulent activity
- Support split-pay or group-based transactions

Optional: Stock Market & Assets Perspective

Teams interested in approaching the problem statement from a markets or asset-focused perspective may explore:

- Asset aggregation and net worth estimation
- Investment or market insights
- Market exposure and risk awareness
- Relationship between spending behaviour and asset growth

Innovation and Freedom

The feature sets above are not exhaustive and are provided to establish evaluation breadth. Teams may pursue alternative approaches that do not rely on the suggested capabilities, provided they address the core problem effectively.

The best entries will be those that rethink how users interact with financial information, and present it in a way that enables better decisions, not just more data.

Important Note on Evaluation: Creativity vs Features

Building a complete product implementing all the suggested features is not compulsory.

However, the judging gives **high weightage to both creativity and feature implementation**. This introduces a trade-off:

- If a solution focuses heavily on implementing the listed features, the feature score may be high, but creativity may reduce.
- If a solution is built with a unique approach beyond the list, the creativity score increases, but the feature count may be lower.

Best-case scoring: Teams that build something original while also incorporating relevant features from the list can score strongly in both creativity and features.

Expected Outcome

A successful submission should demonstrate:

- Clear user problem understanding and reasoning
- Simplicity, usability, and strong experience design
- Smart insights or decision-support (not just raw data)
- Security-conscious and responsible design choices
- Creativity and innovation in approach and execution
